## BACHELOR THESIS CONFIDENTIALITY AGREEMENT

In relation with the Bachelor Thesis Assignment "Volumetric Capnography for spontaneously breathing patients" ("Sistem de monitorizare a respirației spontane prin capnografie volumetrică") of student Raluca Maria Sandu, working with the company Philips Electronics Nederland B.V., hereafter called Philips.

Politehnica University of Bucharest (Automatic Control and Computers) declares, by signing this agreement to keep confidential and secret all information provided by the company to the student including results from research which must be examined with regard to the project or final project. This includes any and all information in relation with the Bachelor Thesis Assignment which is known or reasonably understood to be considered confidential or secret by the company. The confidentiality agreement also includes confidentiality for the employees of PUB, as well as other people who in some way in relation with their function have access to or take notice of the information concerned.

The prior approval of Philips is required for publications in any form whatsoever (which shall also be understood to mean the normal written and oral reporting to the educational institution).

The disclosure of the thesis and all other related reports is not permitted. All correspondence, articles, notes, reports, etc., and all their copies, relating to confidential information must immediately be returned to Philips after the Student's final graduation assessment.

All rights of any kind whatsoever, to the work performed during the Bachelor Thesis Assignment including any rights of industrial and intellectual property which may be attached to this work in the Netherlands or elsewhere, are vested in Philips.

---

First of all, I would like to thank Professor Dan Ștefănoiu for his support in guiding this thesis. His teaching advice and encouraging remarks have motivated me continuously in accomplishing great results. I am grateful for the time he invested in me and his timely interventions.

This work would not have been possible without the steady involvement of my Philips supervisor, Mr. Silviu Dovănescu, who gave me the opportunity to carry out two amazing knowledge-broadening internships at Philips Research and who proposed me this thesis subject. I am thankful for his patience in teaching and explaining me various concepts, for his wisdom in suggesting brilliant solutions and foremost for believing in my “researcher” potential.

Additionally, I would like to thank Professor Cristian Oară and Professor Cătălin Buiu for believing in me, for offering me helpful advice, for supporting me in achieving my academic goals and last, but not least for teaching me so many new notions. Also, many thanks to all the other teachers from the university who shared their knowledge with us, students, who offered us new perspectives and put their effort and time in guiding us during this four years.

To conclude, I would like to thank my friends, firstly for being my friends and staying with me through good and bad times. To Andrei, thanks for bearing me this four years, thank you for staying late nights and weekends with me to solve difficult and easy assignments, thank you for knowing me – you are a great friend. Thanks to Attila for clear explications in the engineering domain and engaging conversations, thanks to my colleague Olguța whose energetic and ambitious spirit led to great teamwork results and increased motivation. Adriana, my friend whom I dearly cherish, a constant inspiration, a source of good humour and knowledge about the world, thank you for comforting me, for bringing a ray of sunshine in my life and for encouraging me from highschool until now. Finally, I would like to thank my family, because without them nothing would have been possible.
